PROFESSIONAL SUMMARY

Computer Science Engineering graduate (B.Tech, 2026) with a focus on Artificial Intelligence and Full-Stack Web Development. Proficient in Python, Java, JavaScript, and data analysis, with a solid understanding of database systems, API integration, and local AI agent deployment. Seeking an entry-level role to apply analytical problem-solving and technical expertise to develop impactful, real-world solutions.

EDUCATION

Siksha 'O' Anusandhan Oct. 2022 – June 2026

Bhubaneswar — Bachelor of Technology, Computer Science and Information Technology

SKILLS

Languages: Python, Java, C++, SQL (Postgres)

Data Annotation & Analysis: Spatial Reasoning (Latitude/Longitude/Depth), Temporal Boundary Tracking, Object/Data Categorization, High-Precision Data Cleaning.

AI & Prompting: Local AI Agent Configuration (OpenClaw, NemoClaw, Claude), MCP Server Integration, Iterative Prompting, Model Output Evaluation, System Feedback Loops.

Algorithmic Trading & Market Analysis: Broker API integration (Fyers) for live NSE/BSE market data, technical indicator computation (RSI, MACD, SMA, pivot points), scanner/signal development.

Full-Stack Web Development: Proficient in building responsive, mobile-optimized applications using HTML, TailwindCSS, and JavaScript. Experienced in backend proxy setup and secure RESTful API integration using Node.js.

Database Management: Solid foundation in database design principles, data structuring, and secure data handling to support dynamic, data-driven web applications.

Developer Tools: Git, GitHub, Jupyter Notebook, Google Colab, Google Antigravity, VS Code

PROJECTS

Multi-Model Earthquake Prediction Framework (*Undergraduate Research*)

- **Data Engineering:** Engineered a data pipeline using USGS ComCat APIs to process large-scale historical seismic datasets, focusing on precise temporal timestamps and spatial coordinates.
- **Modeling & Performance:** Developed models using 3D binning and time lags, achieving exceptional accuracy: 0.9644 R^2 (magnitude), 97.77% (risk), and 99.67% (binary), beating 90% targets.
- **Documentation:** Authored comprehensive research reports and SOPs, translating complex data collection logic into accessible technical documentation.

Algorithmic Trading Scanner — Fyers MCP Integration

- **Architecture:** Built an MCP server integration with the Fyers broker API to pull live NSE/BSE market data directly into a local AI agent.
- **Signal Development:** Built an automated scanner that flags potential breakout trades by tracking price pivot points, moving averages (10/20/50-day), momentum indicators (RSI, MACD), and trading volume across NSE stocks.

AI-Powered Gmail Assistant

- **Development:** Built a local Gmail assistant on the Anthropic API and Google Antigravity framework, with a system prompt covering reply drafting, triage, follow-up tracking, daily digests, and meeting briefs.
- **Safety Design:** Implemented Gmail OAuth2 integration and a four-bucket inbox classification system for automated cleaning, with a hard confirmation gate before any deletions.

Local AI Agent Deployment & Testing

- **Architecture:** Configured a local AI stack (OpenClaw + Ollama) with a dual-model setup — a general-purpose model and a dedicated coding model — and implemented MCP servers to extend agent tool use.
- **Optimization:** Applied systematic troubleshooting to resolve auth regressions, plugin conflicts, and ambiguous model responses, improving the reliability of AI-driven interactions.

BalanceFit – Full-Stack Web Application

- **Development:** Developed a full-stack application to automatically categorize and track granular user health data, including calories and macronutrients, with secure external API integration for data integrity.
- **Deployment:** Hosted the live application at balancefit-api.onrender.com.
